

Point of departure

Abstract

PEvO aims at using the Steem blockchain to create a free and unrestricted **digital archive** of scientific knowledge which is interactive and accessible worldwide. The targeted legal body is a non-profit foundation.

The established practice

- ✓ Authors submit manuscripts at the scientific journal of their choice, following guidelines
- ✓ The evaluation process consists of 2-4 secret prepublication **peer reviews** and the editor's decision
- ✓ False negative and false positive results i.e. **years** of underestimation of valuable work vs. immediate publication of **errorful** content
- ✓ Little incentives for a 'product recall' to correct errors as soon as results are published
- ✓ The only immediate indication of **quality** is the **prestige of the journal** a new paper appeared in
- ✓ Scholars provide their work and/or time for reviewing /editorial work for free, giving up the rights
- ✓ Journals charge **high prices** restricting access to much of the scientific work, illegal sources emerge

The technical basis of PEvO can insure a **resilient system** of scholarly publishing and cycling evaluation. Researchers publish in their own name without limits, keeping all rights. Everyone can freely and permanently access the published work. This means wider readership evaluating a publication and more reputation. The technology allows post-publication references to new findings. They can be attributed to and even integrated into earlier papers, as a quotable new version.

Into the digital age

abolish price-barriers and paywalls

access and make use of relevant literature

overcome exclusivity of knowledge

increase quality and topicality

increase reliability through transparency

give a voice to problem owners

culture of creativity and communication

more time for the „real work“

How it works

PEvO

PEvO is a frontend to scholarly publication and evaluation. A bespoke application to serve the needs of academia, to empower researchers and to allow insight into the state of the art of science for every curious mind.

Steem

Steem is a blockchain serving as a distributed database to archive papers, metadata, (IPFS-)links to attached file(s) and all other relevant information about the article.

IPFS

The InterPlanetary File-System is a peer-to-peer protocol. It locates full articles, raw data and other files referenced on the Steem blockchain, insuring permanent availability.
